

Warranty (or more precisely a lack of any warranty).

All of the circuits on this website (analogsimulation.co.uk) are offered “as is”, “with all faults”, However what I can say is that these simulations run on my computer with an up to date version of LTspice, (version 26.0.0 or version 26.0.1).

In some circumstances (typically for a more complex circuit), I have had to change the the LTspice parameters Gmin, Abstol, and Chgtol, in order to make the simulation run. In these situations these instructions are on the circuit diagram.

I have currently not built any of the circuits that I have presented here, and at present I have not included any guidance on how to build them in a form that will work. As such these circuits are presently just simulations.

I may decide to develop some of these circuits into a form that I can build/manufacture in the future, however that is a lot of work, so at present they are just simulations.
